

## Cookie Recipe

A cookie recipe calls for the following ingredients:

- 1.5 cups of sugar
- 1 cup of butter
- 2.75 cups of flour

The recipe produces 48 cookies with this amount of the ingredients. Write a program that asks the user how many cookies they want to make, then displays the number of cups of each ingredient needed to make the specified number of cookies. The precision of the output for each ingredient must be set to 2, which means the number output should be rounded to two decimal places, and the width of the output should be 7.

Test your program with the following data:

Input	Output		
cookies	sugar	butter	flour
48	1.50	1.00	2.75
100	3.12	2.08	5.73
233	7.28	4.85	13.35

Finally, format your program to match the sample below. Your output should exactly match the sample output, character for character, including all white space and punctuation. User input in the sample has been highlighted in **Pappy's Purple** to distinguish it from the program's output, but your user input does not need to be colored. Save your finished program as `cookie_recipe.py`, and submit it along with a screenshot showing a run of each of the test cases.

### Terminal

```
$ python cookie_recipe.py
How many cookies do you want to make? 233
To make 233 cookies, you will need:
    7.28 cups of sugar
    4.85 cups of butter
    13.35 cups of flour
```
